

Name :- Anjali Punsu

Class:- D20B

Roll No:- 57

Experiment no :- 4

Aim: To create and run virtual machines on a Bare-Metal Hypervisor Xen Server.

Theory :- Xen is an open-source bare-metal hypervisor that allows for efficient virtualization of hardware resources. It enables the creation and management of multiple virtual machines (VMs) on a single physical machine. Xen uses a technique called paravirtualization to achieve high performance and scalability.

Xen is a hypervisor using a microkernel design, providing services that allow multiple computer operating systems to execute on the same computer hardware concurrently. The University of Cambridge Computer Laboratory developed the first versions of Xen. The Xen community develops and maintains Xen as free and open-source software, subject to the requirements of the GNU General Public License (GPL), version 2. Xen is currently available for the IA-32, x86-64 and ARM instruction sets. Xen runs in a more privileged CPU state than any other software on the machine. Responsibilities of the hypervisor include memory management and CPU scheduling of all virtual machines ("domains"), and for launching the most privileged domain ("dom0") - the only virtual machine which by default has direct access to hardware. From the dom0 the hypervisor can be managed and unprivileged domains ("domU") can be launched. The dom0 domain is typically a version of Linux, or BSD. User domains may either be traditional operating systems, such as Microsoft Windows under which privileged instructions are provided by hardware virtualization instructions (if the host processor supports x86 virtualization, e.g., Intel VT-x and AMD-V), or para-virtualized operating system whereby the operating system is aware that it is running inside a virtual machine, and so makes hypercalls directly, rather than issuing privileged instructions. Xen boots from a bootloader such as GNU GRUB, and then usually loads a paravirtualized host operating system into the host domain (dom0).

Steps:

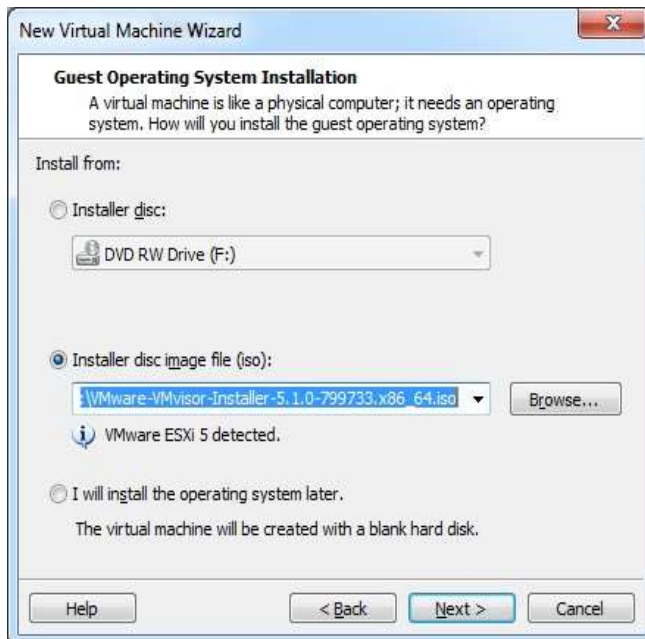

STEP 1: Open the VMware Workstation 10. Go to the File menu. Click on New Virtual Machine option.

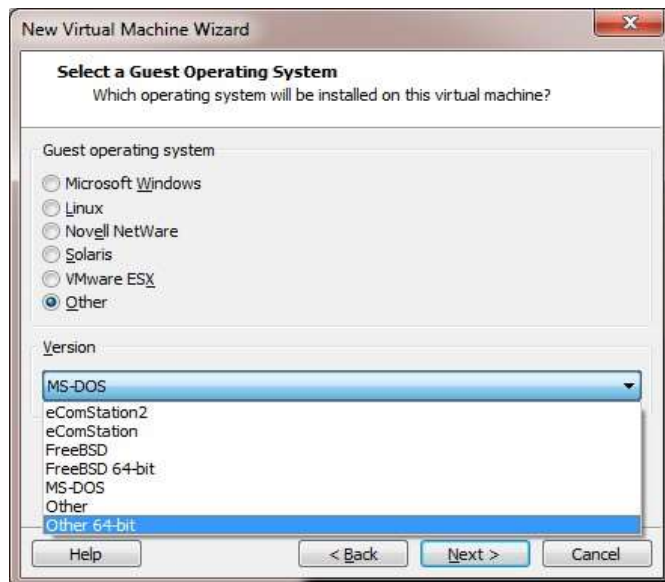

STEP 2: Click on "Typical" option button & click on Next.

STEP 3: Select the option button “Installer disc image file (iso)” & click on Next.

STEP 4: Select the Guest operating system as Other & confirm the version should be Other 64-bit. Then click on Next.

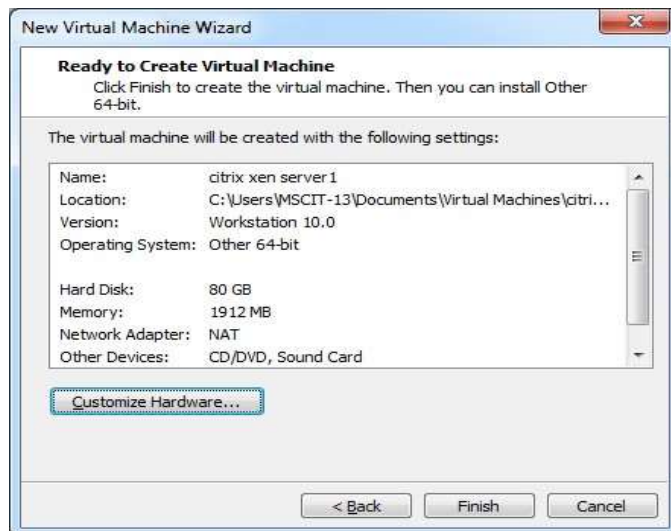

STEP 5: Give the Virtual machine name as Citrix XEN Server & click on the browse for the location & create one separate directory for Citrix XEN Server in your folder & specify the path over here. Then click on Next.

STEP 6: You have to specify the size of virtual hard-disk used for Citrix XEN Server. By default it is 80 GB. Click on Next.

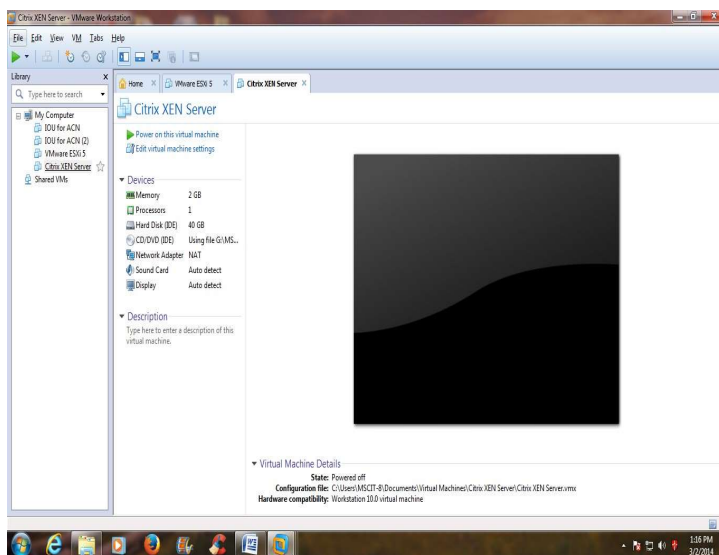

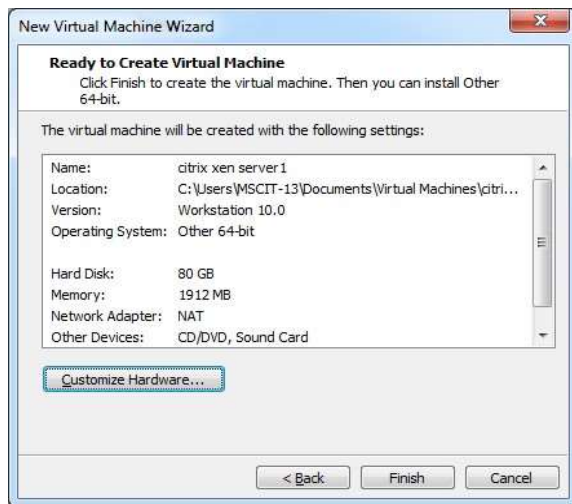

STEP 7: Then it will display the whole hardware information for Citrix XEN Server. Click on Customize Hardware button.

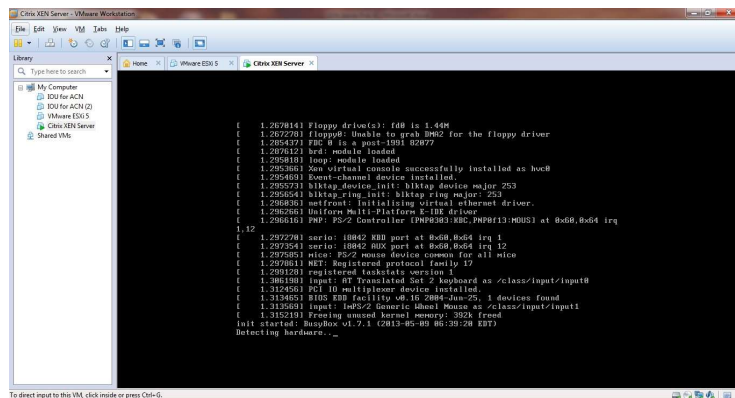

STEP 8: The virtual machine settings will display, by default, memory 256 MB; Select the memory option & from the slider at the right side, make the memory as 2 GB. Then click on Close.

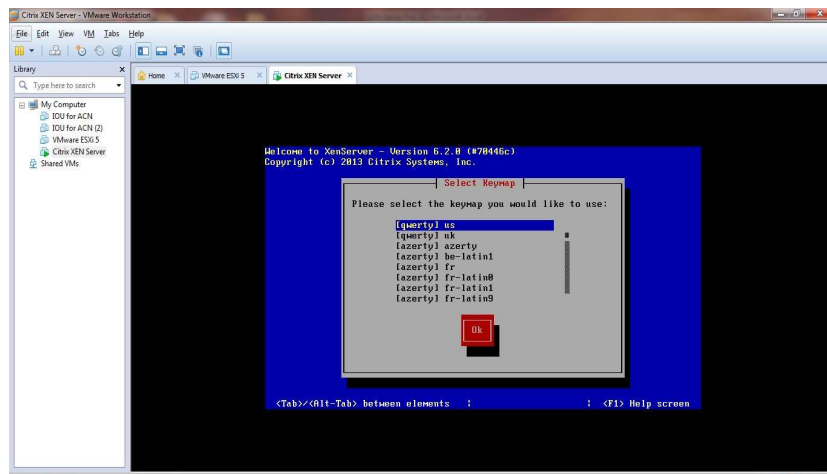

STEP 9: Click on Finish.

STEP 11 Double click on Citrix XEN Server to install it. It will load the XEN installer.

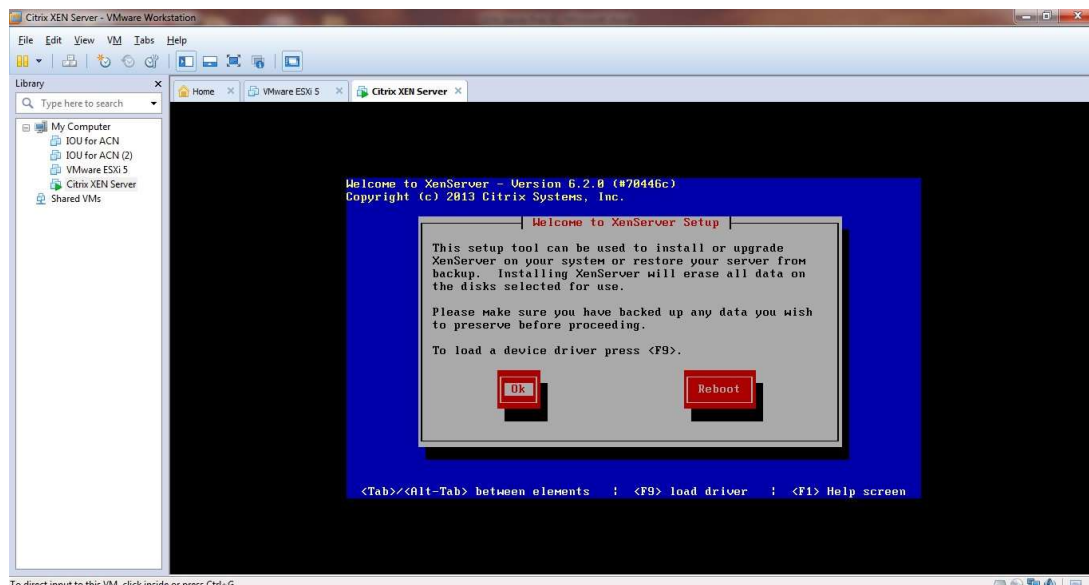

STEP 12: We begin by choosing the keymap.

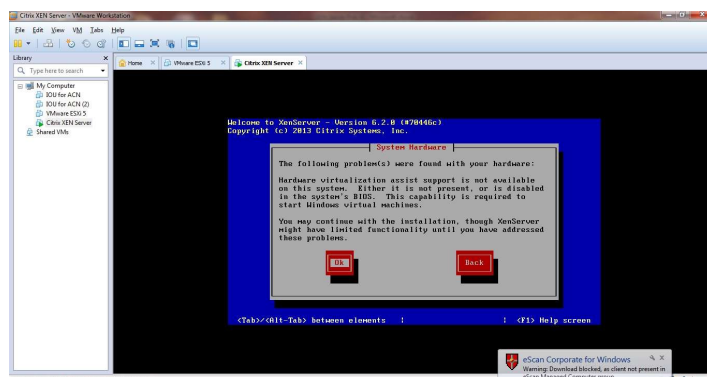

To direct input to this VM, click inside or press Ctrl+G.

STEP 13: Assuming you have backed up your data or are doing an install to a fresh disk (or just don't care about what's on there), we hit OK.

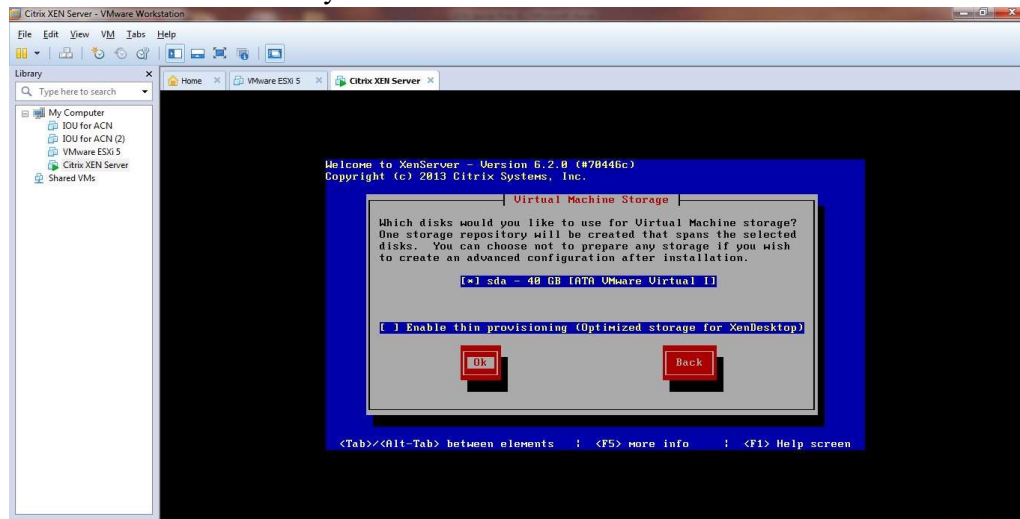

To direct input to this VM, click inside or press Ctrl+G.

STEP 15 Here we choose which disk to install to. In a similar way to ESXi, we don't have the option of software RAID, so here we choose a single disk or available hardware RAID volume. Press space to select a drive. Since we are using a NFS datastore on the network to store virtual machines, this is OK. Moving on.

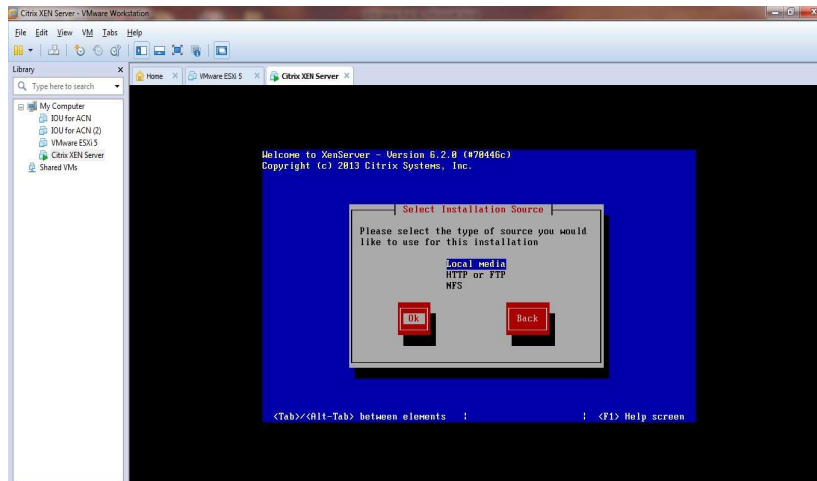

To direct input to this VM, click inside or press Ctrl+G.

STEP 16: Now we can key down to OK.

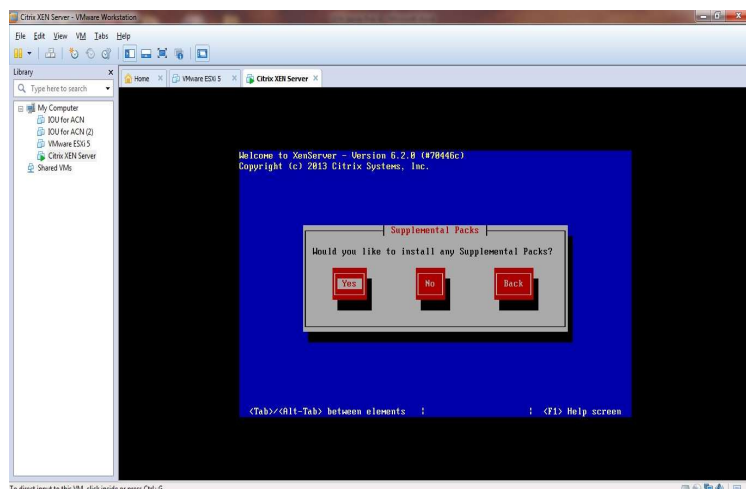

To direct input to this VM, click inside or press Ctrl+G.

STEP 17: We have the install media here so we will use the Local Media option.

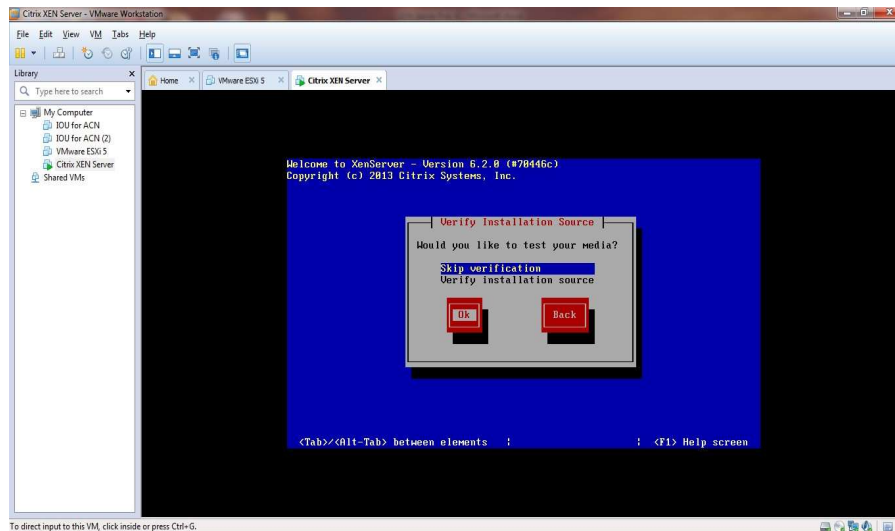

To direct input to this VM, click inside or press Ctrl+G.

STEP 18: If you have to ask what a Supplemental Pack is, you don't have one. Select No. If you select Yes and don't have one don't worry, it won't harm anything.

To direct input to this VM, click inside or press Ctrl+G.

STEP 19 You can Skip verification.

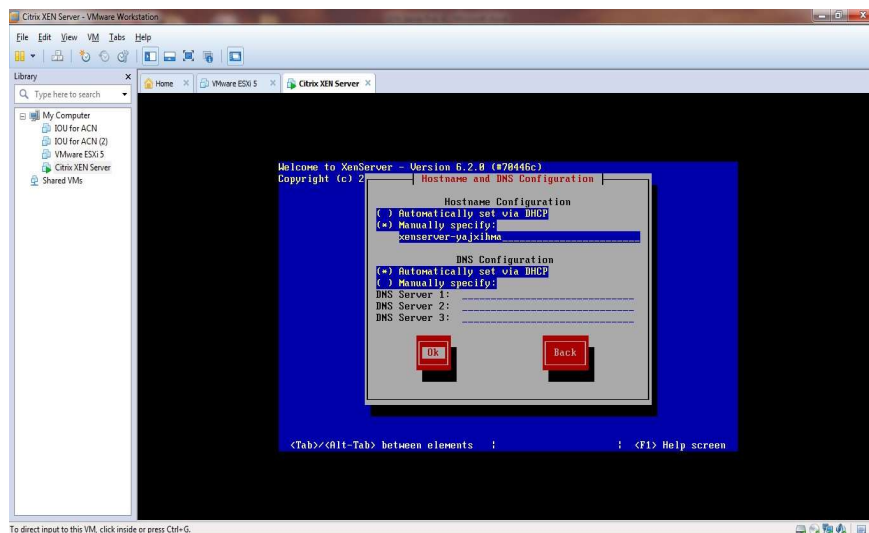

To direct input to this VM, click inside or press Ctrl+G.

STEP 20: It will display the screen for setting the password for root user. Just enter the password & confirm the password. Then hit on Ok.

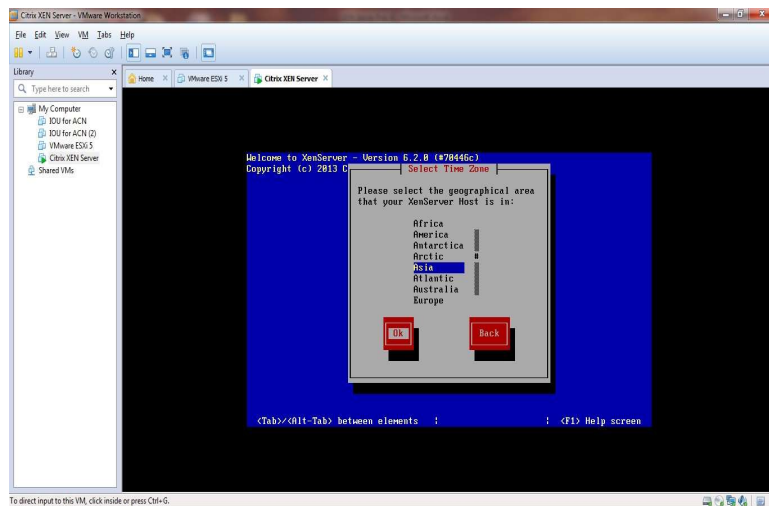

STEP 21 The motherboard we are installing to have two Ethernet ports, both of which are supported by XEN Server. Choose the one you wish to use for the management network – you can change this later. Here we get to choose the networking settings for our management network. This is the IP address used for logging in to manage the XEN Server.

STEP 22: Next we choose the hostname and the DNS server settings – if you're at home you likely use your gateway IP address.

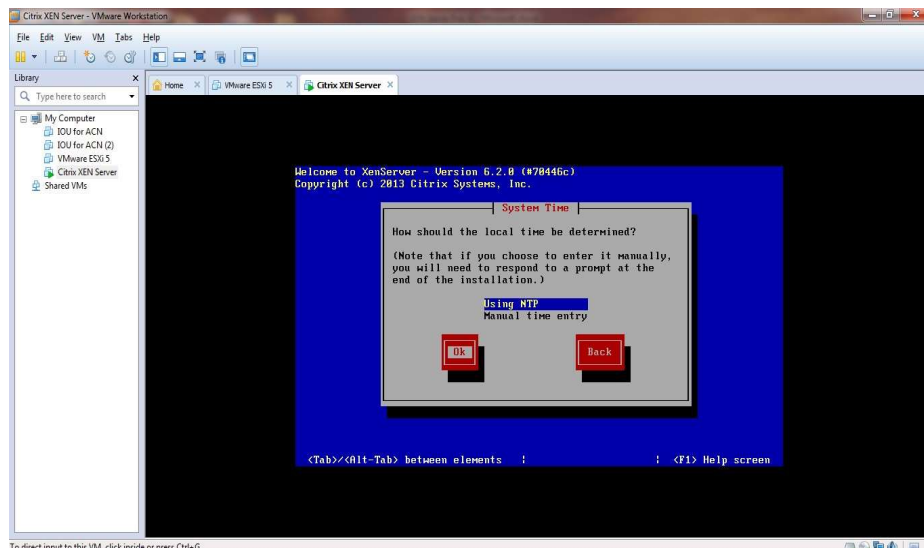

To direct input to this VM, click inside or press Ctrl+G.

STEP 23 Pick your country name & then city name.

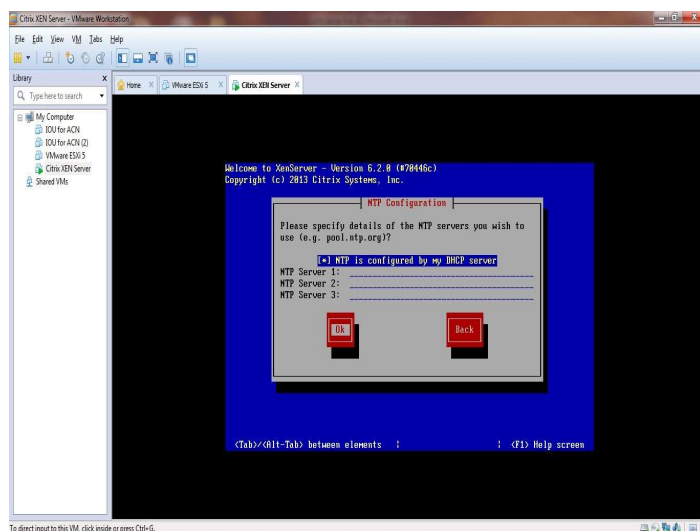

To direct input to the VM, click inside or press Ctrl+G.

STEP 24: Now choose whether to set your time based on an NTP server or on your manual input.

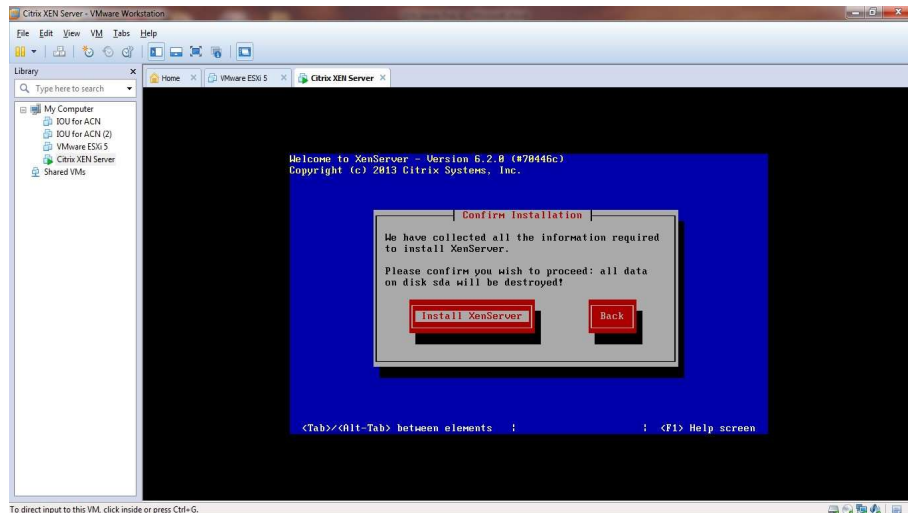

To direct input to this VM, click inside or press Ctrl+G.

To direct input to this VM, click inside or press Ctrl+G.

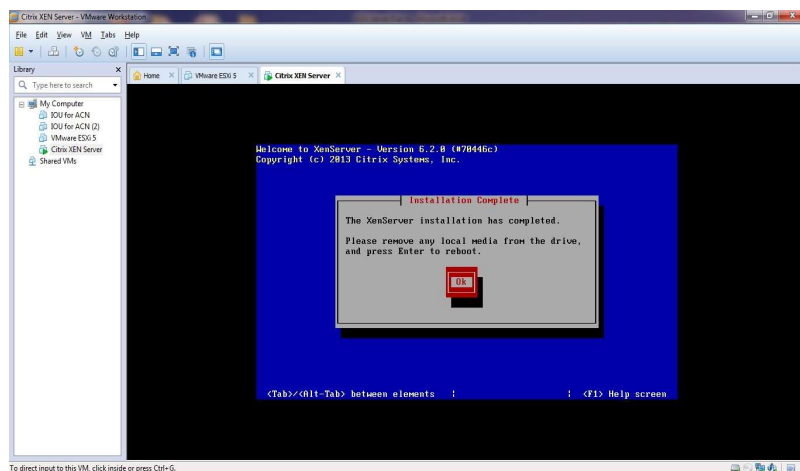

STEP 25 Hit on Install XenServer.

STEP 26: It will show a progress bar so you can see where the install is up to. Once it has done, if you said you did have supplemental packs you should see.

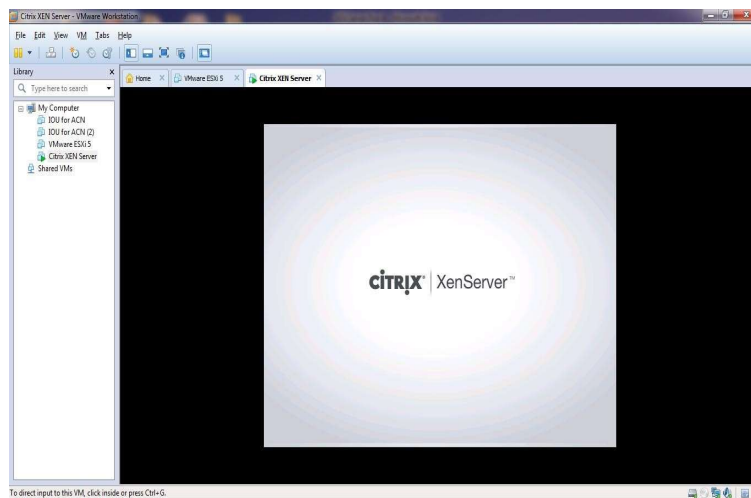

STEP 27: Hit Ok to reboot.

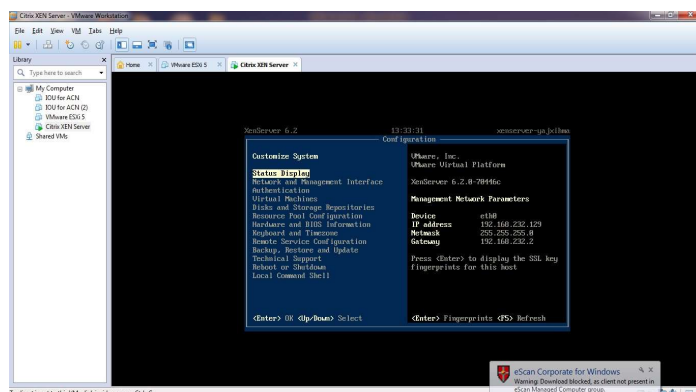

STEP 28: The above is the loading screen for your new XenServer 6.2 install.

STEP 29: Note down IP Address 192.168.232.129. This is the console screen for XenServer 6.2. Installing virtual machine using XenCenter. Open Citrix XenCenter.

Conclusion: After completing this experiment, you will have successfully created and run virtual machines on a Xen Server, demonstrating the ability to leverage virtualization for efficient resource utilization.
